

GLOVES OFF

in critical care

**You don't need to wear gloves
when preparing most IV drugs**

>100 disposable gloves used per patient every day in ICU.¹

**Be glove aware and only wear them
when you need to.**

You don't need to wear gloves for IV drug
preparation unless you're preparing cytotoxic
drugs or monoclonal antibodies.

GLOVES OFF

in critical care

**Before you reach for gloves
stop and ask 'Am I at risk?'**

The risks requiring you to wear gloves at work are:

- 1** If direct contact with blood, bodily fluids, mucous membranes or non-intact skin is likely
- 2** If contact with chemical hazards is likely
- 3** If caring for a patient requiring specific transmission-based precautions (check your local policy)

Unnecessary glove use contributes to environmental damage and skin damage, and it disrupts good hand hygiene practice.

**Be glove aware and only wear them
when you need to.**
